

A website for Ophir Mineral Ventures, Inc.

Built to satisfy compliance review, to help close deals with overseas buyers, and to be run day-to-day by you rather than by a developer.

PREPARED FOR

John David Montilla
Owner, Ophir Mineral Ventures, Inc.

Randolf Segubre
Senior Software Developer

DATE

28 August 2026

STATUS

For your review

In summary

You don't currently have a website. For a company shipping ore in quantities worth six and seven figures to overseas buyers, that absence is doing quiet damage — buyers, their banks, and regulators routinely check a counterparty online before committing, and finding nothing is itself a negative signal.

This proposal covers a custom-built, eight-page website — **in English and Simplified Chinese**, since your buyers are overwhelmingly China-based — that you can update yourself, hosted for roughly the price of a modest monthly dinner, with no ongoing software licence fees. It answers the question you raised about your Google subscription, explains every technical choice in plain terms, and sets out what happens after launch — not just up to it.

Nothing here touches your existing email. That's addressed directly in Part III.

~\$75 / ₱4,640

Infrastructure running cost.
Translation is \$0 as planned — see
Part IX

₱0

XIII Questions you may have

XIV What I need from you

XV Assumptions & approval

PART I

Why this website, and for whom

1.1 The business case

You described the website's purpose as compliance. That's the right starting point, but it undersells what a good site will actually do for you. There are two distinct jobs here:

Compliance & credibility

Marketing & closing deals

A verifiable public presence for regulators, banks, and the compliance teams of overseas buyers. When someone is asked to approve a large transfer to a counterparty, they look. A professional site with visible registrations and permits materially smooths that path.

Something substantial to point a prospective buyer to, instead of a phone number and a trade-directory listing. It works while you sleep, in a time zone where your buyers are awake.

WORTH KNOWING

Publicly available trade records show your shipments going overwhelmingly to buyers based in China. That single fact shapes several recommendations in this document — particularly around how the site should read to a foreign compliance officer, and the decision to build the site in **English and Simplified Chinese from launch** rather than treating that as a future add-on. Cost and timeline impact of the Chinese version specifically are broken out in Parts IX and X, since it's fair for you to see that separately rather than buried in one combined number.

1.2 Who the site is written for

Overseas buyers & their compliance teams

Want: proof you are a real, permitted, documented operation. Product specifications. A clear way to make contact.

Banks & regulators

Want: registered company name, address, permit numbers, transparent ownership. Consistency with what's on your paperwork.

Partners, LGUs, and the local community

Want: legitimacy, an overview of operations, evidence of responsible practice.

You

Want: to update content without paying someone every time a certificate is renewed or a shipment milestone is worth announcing.

PART II

What you're getting

2.1 Eight pages, in English and Chinese

Every page below exists in two language versions — a visitor toggles between them with a switcher in the site header. Not two separate websites: one set of pages, one editing screen, with a Chinese version alongside the English one for each.

PAGE	WHAT IT DOES	YOU CAN EDIT
Home	First impression; headline figures; routes visitors onward	Headline, main photo, key statistics, featured news
About	Company history, leadership, your own background	All text, photos, leadership profiles
Products	Nickel ore and chromite ore — the specifications buyers ask for	Grade tables, photos, downloadable spec sheets
Compliance & Certifications	Registrations and permits — the heart of the compliance purpose	Certificate files, reference numbers, expiry dates
Sustainability	Environmental and community practice — increasingly asked about by buyers	All text and photos
News	Shipment milestones, announcements. Also keeps Google returning	Add unlimited posts yourself
Contact	Enquiry form delivered to your inbox; address; direct contact details	All contact details
Privacy Policy	Required by the Data Privacy Act (RA 10173)	Rarely needs changing

2.2 What "you can edit it yourself" actually means

You'll sign in to a private administration area and see your pages listed much like folders. Click a page, click the text, retype it, press Save and Publish. Swapping a photo is choosing a new file. Adding a news post is filling in a title, a date, and the body.

That control extends to your branding. **Your logo, the small browser icon, product photos, certificate files and every figure on the site are all things you can**

replace yourself from the same screen — so when a certificate is renewed, a logo is refined, or a new assay figure comes in, you're not waiting on me to publish it.

What you deliberately *won't* be able to do is break the design. The layout, fonts, colours and structure are fixed by me at build time; your controls are for content. On a site whose main job is to look credible to a bank, that restriction is a feature, not a limitation — there's no way to accidentally leave the Compliance page looking broken.

INCLUDED AT HANDOVER

A short, plain-language guide covering the handful of things you'll actually do — edit a page, swap a photo, publish a news post, and who to contact if something looks wrong. Written for you, not for a developer.

2.3 Design direction

A separate homepage design draft accompanies this proposal, showing the intended look: restrained, industrial, document-led — the visual language of a company that ships bulk commodities, not a consumer brand.

PLEASE READ THE DRAFT THIS WAY

Everything in it is a placeholder — the logo, the icons, the wording, the figures, the photographs and the certificate details. None of it is real information about your company, and none of it is a suggestion about what your branding should be. It exists purely so you can see the structure and feel before committing to anything.

The mark shown in the top corner is a stand-in drawn to occupy the right space. Your actual logo replaces it — and if you don't have one in a usable digital form yet, that's worth discussing, since it's the one item on the list in Part XIV that can't simply be typed in.

The site will be built mobile-first. Most buyer-side contacts will open a link you send them on a phone, often over a mobile connection, so it must load quickly and read well on a small screen before anything else.

One smaller comfort detail: the site automatically switches between a light and a dark appearance to match whatever the visitor's own phone or computer is already set to

— the same way most apps behave today. Nobody has to find a toggle; it simply looks right for however they've already set up their own device. The homepage design draft does this too, so you can see it in either mode by changing your own system setting.

PART III

Your Google subscription, explained

3.1 What you're actually paying Google for

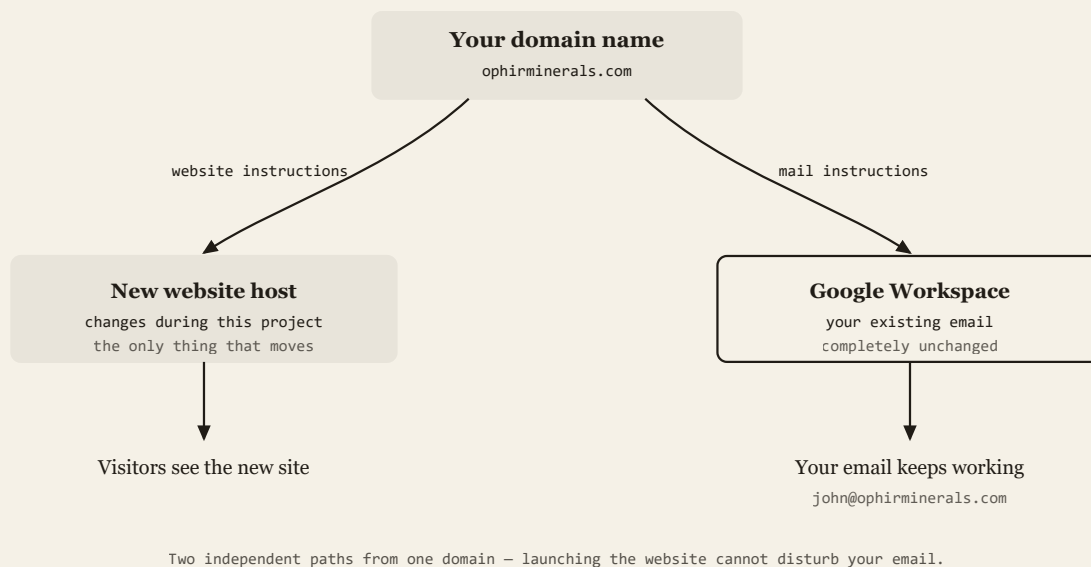

You mentioned having a Google host used for email, and not wanting the template-style website that comes with it. That instinct is correct, and it's worth separating three different Google products that are easy to confuse:

PRODUCT	WHAT IT IS	RELEVANT?
<u>Google Workspace</u>	The paid subscription giving you professional email on your own company domain, plus Drive, Calendar and Docs. <i>This is what you have.</i>	Keep exactly as-is
<u>Google Sites</u>	A very basic website builder bundled inside Workspace. This produces the template look you're reacting against. It cannot run a proper content system, a real enquiry form, or a custom design.	Not used
Google Domains	Google's former domain registrar. Closed and migrated to Squarespace in 2024 — so if you registered a domain through Google before then, it now sits in a Squarespace account.	Need to check where yours is

I also checked specifically whether your Workspace subscription could host the new website, to save you a separate hosting cost. It cannot — Google does not offer a way to run a custom-built site of this kind inside a Workspace plan. Hosting is a separate, small cost, covered in Part IX.

3.2 Your email will not be touched

This is the single most common worry when a business gets a new website, so it's worth showing rather than asserting. A domain name carries two separate sets of instructions: one saying where email should go, another saying where the website lives. They're independent.

Only the website instructions change during this project. Your mail instructions are left exactly as they are, and email continues flowing through Google throughout — including during the launch itself.

PART IV

The technology, and why

4.1 What the site will be built on

The site will use [Umbraco](#), an established open-source content management system, running on [Microsoft's .NET platform](#). In plain terms: Umbraco is the part that gives you the editing screens; .NET is the engine underneath. Both links go to the real product sites — worth a look if you'd like to see what each actually is before taking my word for it.

No licence fee, ever

Genuinely custom

Maintainable long-term

Umbraco is free and open-source under an MIT licence. There's no per-user charge, no revenue threshold, and no expiry. Your only recurring cost is hosting.

Nothing about the finished site will look like it came from a template gallery. The design is built specifically for your company.

This is the technology I work in professionally every day, so I can support it directly — and it's a mainstream platform with a large pool of other developers if you ever need someone else.

4.2 Why not a website builder like Wix or Squarespace?

They're faster to launch and I considered them seriously. Three reasons they lose here:

- **They look like what they are.** Buyers and compliance officers see hundreds of these. A recognisably templated site subtly signals a smaller, less established operation — the exact opposite of what yours needs to convey.
- **You'd be renting, not owning.** Your content and design live inside their system. Moving later means rebuilding from scratch.
- **They cost more to run.** Roughly \$200–470 per year versus around \$75, with less control.

4.3 A word on software versions

The site will be built on the current release of Umbraco (version 18) and Microsoft .NET 10. Being current matters for security, since older versions eventually stop receiving fixes.

SOMETHING YOU SHOULD KNOW UPFRONT

Umbraco 18 is a *standard-support* release rather than a long-term-support one. Its security updates run until **June 2027**, after which the site should be moved to a newer version. Umbraco issues a new major version roughly every six months, so this is best thought of as a modest recurring maintenance task rather than a one-off.

I'm raising it now because it's a real, ongoing consideration rather than something to discover in a year. A longer-support alternative exists (Umbraco 17, supported to late 2028) if you would prefer fewer updates over having the newest version — happy to

switch to that if you'd rather. Either way the cost figures in Part IX are unchanged; what differs is how often the underlying platform needs attention.

PART V

How it's built — architecture

5.1 The shape of the system

You may be shown technical terms by other developers, so here's the plain description of what's being built and why it's appropriate.

The formal description is a **coupled content-management architecture** — a single, self-contained application that both stores your content and produces the pages visitors see. The pages are assembled on the server and sent to the browser as finished HTML.

CHOICE	IN PLAIN TERMS	WHY IT'S RIGHT HERE
One single application	Rather than splitting the site across several separate systems	One thing to host, back up, secure and update. Half the running cost and far less that can go wrong
Pages built on the server	The page arrives complete, rather than being assembled inside the visitor's browser	Google indexes it properly, and it loads fast on a phone over a mobile connection
Deliberately simple internal structure	No elaborate engineering patterns	Those patterns exist to manage complex business rules. A website presenting company information has none, so adding them would add cost and risk with no benefit

That last point is a deliberate decision rather than a shortcut. Over-engineering a simple system is a common and expensive mistake; the discipline is in matching the structure to the actual problem.

5.2 How the site stays fast and protected

A copy of each page is held on a worldwide delivery network ([Cloudflare](#)) that sits in front of your site. For most visitors — the Philippines, banks and regulators, and international buyers outside mainland China — pages are served from whichever location is nearest to them, and your actual server is rarely touched at all.

Fast for most visitors

A buyer in Singapore or Tokyo gets the page from a nearby location rather than from a server on the other side of the world.

Resilient

The network absorbs traffic surges and malicious attacks before they ever reach your site.

Inexpensive

Because the server itself does very little work, a modest hosting plan is genuinely sufficient. This is what keeps the annual cost near \$75.

When you publish a change, that copy is refreshed immediately — you'll see your edits straight away. The hosting server itself will also be placed in Singapore rather than defaulting to the US or Europe, at no extra cost — physically closer to both you and your buyers.

ONE HONEST LIMITATION, SPECIFIC TO MAINLAND CHINA

Given essentially all your recorded buyers are China-based, this deserves a direct answer rather than a footnote. Mainland China routes international internet traffic — including this delivery network — through congested gateways, so a buyer physically inside mainland China will typically see the site load a few seconds slower than everywhere else, occasionally with a retry needed. **The site remains fully working and fully legal to access** either way — no license or China-based entity is required on your end. The registration China requires (an "ICP" filing) only applies to a server physically hosted inside mainland China itself, not to a foreign site simply being viewed from there.

A specialised service exists to close this gap properly, at real additional monthly cost — priced out as an optional upgrade in Part XII, not built into this proposal by default, since it's a genuine investment decision rather than something to assume.

PART VI

Where it lives — hosting

6.1 Two options

Both are equally secure. The difference is operational convenience, not safety — there is no "cheap and risky" option here.

RECOMMENDED TO START

Essential

~\$75 / year

≈ ₱4,640 / year

- Hosted with [SmarterASP.NET](#) — a specialist hosting company that only does this kind of hosting. Not a brand you'd recognise, but well-established and built squarely for this
- Your domain name and hosting
- Secure connection (the padlock in the browser)
- Daily automatic backups
- Firewall and attack protection

IF YOU WANT MORE HEADROOM

Managed

~\$232 / year

≈ ₱14,353 / year

- Everything in Essential
- Hosted on [Microsoft Azure](#) — Microsoft's own cloud platform, a name you may recognise
- A test copy of the site for trying changes safely
- Built-in performance monitoring

Both sit behind the same **Cloudflare** delivery network described in Part V, which is what actually serves most visitors — so **my recommendation is Essential**. Because of it, your visitors' experience is effectively identical on both. Managed buys convenience for me and easier growth later — worth revisiting if the site ever becomes busier or changes more often. You can move between them later without rebuilding anything.

6.2 Why not Umbraco's own hosting?

Umbraco sells its own fully-managed hosting service, [Umbraco Cloud](#), starting at roughly \$660 per year (≈₱40,833), rising to considerably more. It's a legitimate product that removes most server management work — but that convenience is priced for organisations without a developer. Since you have one, it would be paying to avoid something already covered.

Security

7.1 What protects the site

Worth being clear about the risk profile first: this site holds no customer accounts, no payment details, and no sensitive records. The only information it receives is enquiry-form messages. That's a deliberately small target, and the protections are sized accordingly — thorough where it matters, without paying for enterprise measures that address risks you don't carry.

Encrypted connections

All traffic over HTTPS, so visitors see the padlock. Certificates renew automatically.

Protected sign-in

Two-factor authentication on your administrator account, plus limits on repeated login attempts.

Firewall & attack filtering

Malicious traffic is filtered before it reaches the site.

Spam-resistant enquiry form

Automated filtering and rate limiting, so the form doesn't become a nuisance channel.

Backups, held off-site

Daily, stored separately from the site itself, and periodically test-restored — an untested backup isn't really a backup.

Data Privacy Act compliance

Published privacy policy, explicit consent on the enquiry form, and minimal retention of personal information (RA 10173).

Almost all of the above costs nothing beyond the hosting already listed. Paid security upgrades exist, but none of them close a gap that matters at this site's size and risk profile — so they're not included, and I'd rather say so than bundle them in.

Being found on Google

8.1 Search engines

A useful shortcut: **Yahoo's search results have been supplied by Bing since 2015.** Covering Google and Bing therefore covers effectively the entire market, Yahoo included. No separate work is needed for Yahoo.

Included at launch:

- Site registered with both [Google Search Console](#) and [Bing Webmaster Tools](#), with a sitemap submitted to each
- A [Google Business Profile](#) created, so the company appears on Google Maps and in local results
- Each page given its own title and description, written for the terms buyers actually search
- Structured company information embedded so search engines can identify the business correctly
- Existing trade-directory listings pointed at the new official domain

A REALISTIC EXPECTATION

Search visibility builds over months, not days, and "nickel ore exporter Philippines" is a competitive term. Realistically, most early traffic will come from people you've directed to the site — which is exactly what matters for the compliance and deal-closing purposes. Search visibility is a compounding bonus on top, helped by posting to the News page occasionally.

PART IX

Cost

9.1 First year

ITEM	USD	≈ PHP*	NOTES
------	-----	--------	-------

Domain name (.com)	\$15	₱928	Annual renewal. You likely already pay this for ophirminerals.com — if so, deduct it. A .com.ph is ~\$40–60 if you'd prefer a local address
Hosting	\$60	₱3,712	Roughly \$5/month, secure connection included. A \$3/month plan also covers this site if you'd prefer
Database	\$0	₱0	Built into the hosting; no separate service required
Delivery network & firewall	\$0	₱0	Cloudflare's free tier genuinely suffices at this scale
Software licence (Umbraco)	\$0	₱0	Free and open-source, with no cap
Enquiry form & email delivery	\$0	₱0	Built directly rather than licensed
Backups & uptime monitoring	\$0	₱0	Free tiers, sufficient for this site
Photography — your own photos <i>(recommended)</i>	\$0	₱0	You supply real operations/product photos and one of yourself. This is the default this proposal is costed on — real photos build more credibility here than professional ones would
Photography — professional photographer <i>(optional upgrade)</i>	up to \$150	up to ₱9,280	Only if you'd rather pay for this instead of using your own photos. Entirely your choice — not needed, and not included in the total below unless you ask for it
Chinese translation — you or your team provide it <i>(the plan for launch)</i>	\$0	₱0	You review/supply the Simplified Chinese text yourself, or a bilingual colleague does. This is what the site is being built for — no cash cost, but real time from your side, and accuracy matters here more than almost anywhere else on the site
Chinese translation — professional translation service <i>(only if you decide you need it)</i>	~\$200–400	~₱12,374–24,747	Held in reserve, not part of the initial plan. If your own translation ever feels like a struggle to keep up with, or you'd simply rather not, switching to this is a conversation, not a rebuild — my estimate for the initial site content (~2,000–2,500 words), at standard

**First-year
infrastructure total**

~\$75

~₱4,640

Unaffected by which photography or translation option you pick — those are content costs, priced separately above, not infrastructure

* Peso amounts are converted at today's exchange rate and are approximate — see the note at the end of Part IX for why they'll differ slightly whenever you actually check.

TRANSLATION ISN'T A ONE-TIME COST — WORTH PLANNING FOR

Unlike photography, this isn't fully optional: once the site is bilingual, every future update needs a Chinese version too, or the Chinese pages quietly fall behind the English ones and stop being trustworthy. A news post, an updated certificate note, a changed spec — each needs translating before it goes live in both languages.

Budget for this as an ongoing habit, not a launch-day expense: either build in the time to translate your own updates, or expect a small recurring cost if you use a translation service going forward. I'll flag anything you publish in English only, so the Chinese version never silently goes stale without you knowing.

9.2 Every year after

ITEM	USD	≈ PHP*
Domain renewal	\$15	₱928
Hosting renewal	\$60	₱3,712
Annual total	~\$75	~₱4,640

TWO THINGS WORTH KNOWING ABOUT THESE FIGURES

The hosting provider does not raise prices at renewal. Whatever monthly rate is locked in at signup is what continues to be charged — unusual in this industry, where introductory rates commonly triple after the first year. Worth having in writing.

Domain prices are rising slightly. The organisation that administers .com addresses is increasing its wholesale fee from 1 November 2026, so expect the \$15 renewal to

drift upward by a dollar or two in future years. Minor, but I'd rather flag it than have it appear as a surprise.

A NOTE ON THE PESO FIGURES

Every peso amount in this proposal (marked with *) is a conversion, not a price — the actual cost is fixed in **US dollars**, since that's how hosting, domains and software are billed internationally. The peso amount just tells you roughly what that means in local currency **today**.

The rate used is **₱61.87 to US\$1, as at 28 August 2026**, and it moves most days — over the past year it has ranged between ₱56.54 and ₱61.95, so today's rate happens to sit near the top of that range. If you check again next month, expect the peso figures to have shifted a little even though the dollar cost hasn't changed at all.

Treat every ≈₱ figure here as **approximate, for planning purposes** — I'll always confirm the live rate before anything is actually invoiced.

9.3 Why so little?

A fair question when website quotes commonly run to six figures in pesos. Three reasons:

- **No licence fees.** The content system is free and open-source. Much of what agencies charge for annually is licensed software and page-builder subscriptions.
- **Right-sized hosting.** The delivery network described in Part V means a modest plan performs like an expensive one.
- **The figures above are running costs, not development.** Build work isn't itemised here — that's a separate conversation between us (Part XI), and it's the one number in this document that's a discussion rather than a calculation.

PART X

Deployment plan

10.1 Seven phases, about seven to eight weeks

Two weeks longer than a single-language build — the extra phase is translation, which has to wait for the English content to be finalised before it can start.

PHASE	WHAT HAPPENS	WHAT I NEED FROM YOU
1 · Discovery	Confirm the domain situation, agree the page list, gather your materials	The items in Part XIV
2 · Setup	Register or redirect the domain, set up hosting and the delivery network, install the content system	Domain login details, or authority to register a new one
3 · Build	Build the design and every page template, in both languages; build the enquiry form	Nothing — heads-down work
4 · Content	Load your real English text, photos and certificates; write page titles for search	Prompt answers to content questions as they arise
5 · Translate	The finalised English content is translated into Simplified Chinese and loaded as the Chinese version of each page	Your translation-source decision from Part XIV; review time if you're providing or checking it yourself
6 · Review	Testing across phones and browsers in both languages, security checks, then a walkthrough with you	~1 hour with me, and your feedback — ideally including a Chinese-fluent read-through
7 · Launch	Point the domain at the new site, confirm email still works, submit to search engines	Final approval to go live

WHAT DETERMINES THE TIMELINE

Honestly: the build itself is predictable — what usually sets the pace is how quickly photos, certificate copies, approvals, and now translation turnaround come back. If those arrive promptly, seven to eight weeks is comfortable. If they take longer, the project takes longer. Translation specifically can't start until the English content is

locked, so late content changes push the whole back half of the timeline, not just Phase 4.

10.2 Launch day

The change itself is small and reversible. I switch the website instruction on your domain to point at the new site; the mail instruction is left untouched. The new site typically appears within an hour and is fully propagated worldwide within 24–48 hours.

During that window some visitors may briefly still see the old state — which, since there's no existing site, simply means the new one appearing at slightly different times in different places. **Your email continues working throughout, without interruption.** I verify this explicitly as part of launch rather than assuming it.

PART XI

After go-live

11.1 What ongoing care involves

A website isn't a one-off purchase. Software needs updating, backups need verifying, and certificates on your Compliance page expire. None of it is heavy, but it isn't zero either — and it's better agreed now than discovered later.

HOW OFTEN	WHAT HAPPENS	WHO
Ongoing	You add news posts, update text, swap photos, replace renewed certificates — and get each one translated before it's published, per whichever arrangement from Part XIV	You
Monthly	Security updates applied; confirm backups actually ran	Me
Quarterly	Check for broken links, review certificate expiry dates, test-restore a backup	Me

Annually	Renew domain and hosting; review whether the hosting tier still fits	Me, with your approval on renewals
~Yearly	Move to a newer Umbraco version before the current one stops receiving security updates (see 4.3 — first one due before June 2027)	Me

11.2 Support arrangement

Worth settling explicitly, so "who fixes it if something breaks" is never ambiguous.

Two sensible options:

Included

I continue supporting the site as part of our working relationship, at no additional charge. Simple, informal, and dependent on my availability — best-effort rather than guaranteed response times.

Light retainer

A small predictable monthly fee — the Philippine market rate for this scope runs roughly ₱2,000–6,000 (≈\$32–97) — covering the routine work above with priority turnaround.

Either is genuinely fine by me. The retainer mainly buys predictability and a clearer claim on my time; the included arrangement is simpler. Your call, and easy to change later.

11.3 What this plan assumes

The plan above holds under the following assumptions. If any turns out differently, it's worth revisiting — none is a problem, but each would change something:

- **Traffic stays modest.** A business-to-business site visited by buyers, banks and partners — not consumer-scale volume. A sudden surge would mean moving to the Managed tier.
- **Content changes occasionally, not daily.** Monthly-ish updates. Daily publishing would justify the test-environment setup in the Managed tier.
- **The site stays informational.** No online payments, customer accounts, or buyer login portal. Any of those changes the security requirements materially and would need separate planning.

- **Your Google Workspace email continues as-is**, billed and managed by you, unaffected by this project.
- **Two languages at launch** — English and Simplified Chinese, on every page, with a visitor-facing switcher. This is a scope addition from the original single-language plan, reflected in the cost (Part IX) and timeline (Part X) above.
- **Content is supplied by you** — text, photos, certificates. I'll draft and structure it, but the underlying facts, figures and documents have to come from your side. Nothing about your business will be invented to fill a gap.
- **I remain available** for maintenance, per whichever arrangement in 11.2 we agree. If that ever changes, the platform is mainstream enough that another developer can take it over.

11.4 Using this project in my own portfolio

Worth asking directly rather than assuming: I'd like your permission to reference this project — the design and the underlying code — in my own professional portfolio, and to show it to potential future clients as an example of my work.

Would be shown

The visual design, the general architecture and technical approach, and code structure and patterns — with any real business data replaced by placeholders before anything is shown to anyone.

Would never be shown

Your actual registration numbers, permit or certificate documents, real business figures, the names or details of your buyers and trading partners, or anything else you've asked to keep confidential.

One technical detail that helps here: the way the site is built, your actual page content lives in the site's database, not in the underlying code itself — the two are kept separate by design. So the code I'd be showing was never going to contain your real content in the first place, rather than needing to be stripped out afterwards.

This is entirely your call, and it doesn't affect anything else in this proposal either way. If you're comfortable with it, note it in the sign-off below — and even then, I'd check with you before publishing anything specific, rather than treating a yes here as a blank cheque.

Future improvements

12.1 Deliberately not in this phase

All of these are sensible later. None is needed to launch, and including them now would add cost and delay without improving the site's core purpose.

China delivery acceleration

A different lever from the Chinese-language version, which is now part of the core scope (Part II.1) rather than a future item — that one is about what the site says, this is about how fast it arrives for mainland visitors specifically. Addresses the loading-speed limitation noted in Part V.2. A specialised service (e.g. [Chinafy](#)) brings mainland load times close to normal, from roughly **\$280/month (≈\$3,360/year)** — a real jump from the ~\$75/year baseline, so worth doing once real traffic data shows buyers are actually visiting often enough to justify it, not before. No ICP license or China entity needed on your side either way; the service handles that layer.

Buyer enquiry portal

A structured quote-request system rather than a general enquiry form, if inbound volume ever justifies it.

Careers page

Straightforward to add whenever hiring becomes regular.

Advertising

Considered as a way to offset running costs. Set aside for now — at this site's realistic traffic it would generate very little, and advertisements sit awkwardly on pages a bank is reviewing. Revisit later with real traffic data if you'd like.

Questions you may have

Will this affect my current email at all?

No. Email and website are controlled by separate settings on your domain, and only the website setting changes. I verify your email is working as part of launch rather than assuming it. See 3.2 for the diagram.

Do I own the website?

Yes — entirely. The domain is registered in your company's name, the content is yours, and the software is open-source with no licence tying you to anyone. If you ever wanted to move to a different developer, everything transfers.

What if you become unavailable?

A fair question to ask of any solo arrangement. The site is built on mainstream Microsoft technology with a large developer pool, deliberately rather than on anything exotic. Everything is documented and stored in a standard version-control system, so another developer can pick it up. I'd rather you have that assurance in writing than take it on trust.

Can I see it before it goes live?

Yes. You'll review it on a private address in Phase 5, before anything is public, and I'll walk you through it. Nothing goes live without your approval.

What if I want changes after launch?

Content changes — text, photos, news, certificates — you do yourself, at no cost. Design or structural changes come to me, under whichever support arrangement we agree in 11.2.

Is it safe to publish our permit numbers?

That's your judgement to make, and worth a conversation. Generally, publishing registration and permit references is standard practice for exporters and actively helps due-diligence checks — it's what a compliance officer is looking for. But you know your regulatory and competitive situation better than I do. Publish only what you're comfortable with; the site works either way.

Why does the site need to be fast if we only have a few visitors?

Because of *who* those visitors are. A slow, awkward site read by a bank's compliance officer on a phone does real damage; the same site read by a thousand casual visitors wouldn't matter at all. Low traffic, high stakes per visit.

Could we just use the free Google website builder?

You could, and it would cost nothing. But it produces exactly the templated look you told me you wanted to avoid, and it can't run a proper enquiry form or document library. For a site whose purpose is to signal that this is an established operation, it works against you. See Part III.

Will the Chinese version actually read well, or is this a machine translation?

The plan is you or a bilingual colleague provides/reviews it — I'm not fluent in Chinese myself, so I won't be the one judging quality either way. What I'd actively avoid is publishing raw machine translation with no human check: on a site whose whole purpose is credibility with Chinese buyers, an awkward or slightly-off translation can undercut that credibility rather than build it. If that ever feels like more than you want to keep up with, a professional translator (roughly \$200–400, Part IX) is available any time — switching later is easy, since it's a content swap, not a rebuild.

Couldn't the browser just translate the page automatically, like Chrome does? Would that save the translation cost?

A fair thing to ask, and worth checking properly rather than assuming — I did. Short answer: no, and not by a small margin. Chrome's built-in translate has been non-functional inside mainland China since 2022, because it relies on Google's translation service, which is blocked there — for a buyer browsing from mainland China without a VPN, the "auto-translate" button simply doesn't work at all, not just badly. On top of that, browser translation is invisible to search engines — they index what's actually sent to them, not text a browser swaps in afterwards — so relying on it would mean the site never appears in Chinese-language search results either. A properly built Chinese version isn't the expensive way to reach these buyers; checking showed it's the only way that actually reaches them.

What I need from you

These are the things only you can provide. The sooner they arrive, the sooner the timeline in Part X starts.

- ☐ **Domain access** — I've assumed the website will live at **ophirminerals.com**, since that's where your email already runs. I need to know which registrar you log into to manage it (it may be Squarespace, if it originally came from Google), and confirmation you're happy using that same address for the website. If you'd prefer a different or additional address, tell me which.
- ☐ **Company registration details** — SEC registration, DTI/BIR details, exactly as you want them displayed publicly
- ☐ **Permits and certifications** — which ones you're comfortable publishing (DENR-MGB, ECC, others), with current copies
- ☐ **Logo and brand materials** — ideally the original artwork file (AI, EPS, SVG or a large PNG). A logo taken from a document or a photograph usually won't reproduce cleanly at web sizes. If nothing suitable exists, say so and I'll design a wordmark — worth deciding early, as it affects the whole visual identity
- ☐ **Photographs** — operations, ore samples, facilities, and one of yourself. Real photos matter here; stock imagery actively undermines credibility with the audience this site is for
- ☐ **Your background** — how you'd like your role and history described on the About page
- ☐ **Product specifications** — typical grades and assay figures you're willing to publish
- ☐ **Business address, phone, and hours** as they should appear publicly
- ☐ **Who's translating (and staying available for future updates)** — the plan is you or a bilingual colleague, at no cash cost, confirmed before Phase 5 (Part X). I just need to know who that person is. A professional translator (~\$200–400, Part IX) stays available any time you'd rather switch — nothing about the build changes if you do, it's a conversation whenever it comes up, not a decision you're locked into now

- ☐ **Confirmation** that your Google Workspace email should be left exactly as it is

ON ACCURACY

Nothing about your company will be invented or approximated to fill a gap. Until you supply real registration numbers, permit references, addresses and figures, those areas stay visibly marked as placeholders and the site does not go live. On a website whose entire purpose is being verifiable, a plausible-looking but incorrect detail is worse than an obvious blank.

PART XV

Assumptions & approval

15.1 Please note

- Costs are running costs (hosting, domain, services) and exclude development work, which is a separate discussion between us.
- Third-party prices — hosting, domains, Google Workspace — are set by those providers and may change.
- Peso figures use ₱61.87 to US\$1 as at 28 August 2026 and will drift with the exchange rate.
- The six-week timeline assumes materials and approvals arrive promptly (Part X).
- Software versions were current as at 28 August 2026; the version note in 4.3 applies.
- Any figures or details shown in the accompanying design draft are placeholders for illustration, not statements about your business.

15.2 To proceed

If this looks right, four decisions and then we can begin:

1. **Hosting option** — Essential (recommended) or Managed

2. **Support arrangement** — included, or a light retainer
3. **Software version preference** — newest (Umbraco 18, updated roughly yearly) or longer-support (Umbraco 17, supported into late 2028). See 4.3
4. **Who's translating** — you/your team is the plan (name the person); a professional service stays available later if you'd rather switch. See Part XIV

APPROVED BY (NAME & ROLE)

DATE

HOSTING OPTION

SUPPORT ARRANGEMENT

VERSION PREFERENCE

TRANSLATOR (NAME)

PORTFOLIO USE — YES/NO (PART XI.4)

SIGNATURE

The portfolio line isn't one of the four decisions above — it doesn't affect whether or how the project proceeds either way, it's just the easiest place to record your answer once you've read Part XI.4.

Happy to walk through any part of this on a call — particularly the hosting and support choices, which are the two worth a conversation rather than a decision made from a document.

REFERENCES

See for yourself

Every company and tool named in this proposal, in one place, with a link to its real website. Everything above is linked in context too — this is just a single spot to check them all without hunting back through the document.

NAME	WHAT IT IS HERE	WEBSITE
Umbraco	The content management system — what gives you the editing screens	umbraco.com
.NET	Microsoft's platform the site runs on, underneath Umbraco	dotnet.microsoft.com
SmarterASP.NET	Recommended hosting — the <i>Essential</i> option (Part VI)	smarterasp.net
Microsoft Azure	Alternative hosting — the <i>Managed</i> option (Part VI)	azure.microsoft.com
Umbraco Cloud	Umbraco's own hosting — priced out and not recommended (Part VI.2)	umbraco.com/products/umbraco-cloud
Cloudflare	The delivery network and firewall sitting in front of either hosting option	cloudflare.com
Google Workspace	Your existing email service — unaffected by this project	workspace.google.com
Google Sites	The basic builder bundled in Workspace — the template look this proposal avoids (Part III)	workspace.google.com/products/sites
Google Search Console	Free tool for monitoring how Google indexes the site (Part VIII)	search.google.com/search-console
Bing Webmaster Tools	Same, for Bing — and therefore Yahoo, which uses Bing's results (Part VIII)	bing.com/webmasters
Google Business Profile	Free local listing on Google Maps and in local search (Part VIII)	google.com/business
Chinafy	Optional mainland-China acceleration service, not included by default (Part V.2, Part XII)	chinafy.com

All links go to each company's own official site — worth a look at any of them before deciding, rather than taking my description on trust. If a link doesn't work from within your PDF viewer, copy the address shown into a browser.
