

A website built around how Ophir Mineral Ventures actually does business.

Not a template — something you can run yourself day to day, that also does the quiet work of reassuring buyers, banks, and regulators that they're dealing with a serious company.

Prepared for **John David Montilla**, Ophir Mineral Ventures, Inc. — August 2026

Why this, and why now

Right now, anyone checking out Ophir Mineral Ventures online — a buyer's compliance team, a bank processing a large transfer, a potential partner — finds nothing. A well-built site fixes that in two ways at once: it gives you something solid to point to during due diligence, and it gives you a professional space to present the company when you're trying to close a deal.

This proposal covers what the site would include, how it would be built, what it costs to run, and — since you asked directly — what your Google Workspace subscription can and can't do here.

What's included

Eight pages, each editable by you afterward without needing a developer for routine changes:

Home

First impression, headline stats, what the company does

Products

Nickel ore & chromite ore — specs buyers actually ask for

Sustainability

Environmental & community practices

Contact

Inquiry form, routed to your email

About

Company story, your role, leadership

Compliance & Certifications

Permits, registrations, downloadable documents

News

Shipment milestones, updates — add posts anytime

Privacy Policy

Required disclosure under the Data Privacy Act

A separate homepage design draft is attached alongside this proposal so you can see the actual look and feel before anything is built.

About your Google Workspace

You mentioned not wanting a site built on the templates that come with your Google hosting — worth unpacking exactly what that subscription is and isn't, since the terms get confusing.

What you're paying for is **Google Workspace**: professional email on your own domain (the @ophirmineralventures.com address), plus Drive, Calendar, and related tools. It includes a very basic website builder called **Google Sites** — that's almost certainly the "template" look you're trying to avoid. Google Sites can't run a real content management system, can't handle a proper contact form with routing, and has no ability to build the kind of custom design shown in the attached draft.

THE GOOD NEWS

Your email doesn't need to move, change, or go through any risk at all. A domain's technical settings let email and website point to two completely different places at once — so the new site goes live on its own without touching your Workspace email in any way.

Checked whether your Workspace subscription could host the new site directly, to save you a separate hosting cost — it can't. Google doesn't offer a way to run a

custom-built site like this one within a Workspace plan; that requires its own hosting, covered in the options below.

The technology, briefly

The site will be built on **Umbraco**, a mature, widely-used content management system that's free and open-source — no software license fee, ever, regardless of how the business grows. It runs on **ASP.NET Core**, Microsoft's platform for building web applications, which is what gives the finished site a genuinely custom design rather than a page-builder look.

You get a simple editing screen for text, images, and documents — similar in spirit to editing a Word document — while everything underneath stays fully custom and fully secure.

Hosting options

Two ways to run it. Both are equally secure — the difference is convenience, not safety.

RECOMMENDED TO START

Essential

~\$75/year

≈ ₱4,640/year

Covers the domain and hosting. Everything the site needs, nothing extra.

- Custom domain, free SSL (the padlock/https)
- Daily automated backups
- Firewall & attack protection included

IF YOU WANT MORE HEADROOM

Managed

~\$232/year

≈ ₱14,353/year

Same security, hosted on Microsoft Azure with a safety-net environment for testing changes before they go live.

- Everything in Essential
- A staging copy of the site for testing updates

-
- Built-in performance monitoring

EXCHANGE RATE — AS OF TODAY

Peso amounts above use the mid-market rate **as of August 28, 2026: ₱61.87 to US\$1**. This rate moves daily, so treat the peso figure as today's guide rather than a fixed price — I'll confirm the live rate again before any invoice.

Either option can move to the other later without rebuilding anything.

Keeping it running

Worth agreeing on up front, in writing, so it's never ambiguous: who handles updates, backups, and the occasional fix.

OPTION	WHAT IT MEANS
Included	I continue supporting the site as part of our working relationship, at no additional charge.
Light retainer	A small, predictable monthly fee (Philippine market rate for this scope runs roughly ₱2,000–6,000/month, ≈\$32–97) covering routine updates and priority turnaround.

Either is fine — this is really just about your preference for predictability versus keeping things informal.

Timeline

Roughly six weeks from kickoff to launch, most of it gated by the items below rather than the build itself.

A few things I need from you

- ① Your preferred domain name, and confirmation of where it's currently registered (if at all)
- ② Which certifications/permits you're comfortable displaying publicly (SEC, DTI, DENR-MGB, etc.), with current copies
- ③ A logo, or the go-ahead to design one from scratch
- ④ A handful of real photos — operations, product, and one of you — real photos build far more trust than stock images
- ⑤ How you'd like your own role and background described on the About page
- ⑥ Whether a future Chinese-language version is of interest, given most of your buyers are China-based

Happy to walk through any of this on a call. Once I have the above, I'll move straight into the build.
